Atal, Bihari Vajpeyee Residential School Dharawad Karnataka

Abstract: The study was intended to explore the self-concept of under nineteen volleyball and cricket players. The present study was carried with the help of descriptive research design. 400 volleyball and cricket were selected by using convenient sampling technique. The results of the study indicate no significant difference has been found between volleyball and cricket players on their level of self-concept. Thus, from the study it was inferred that the type of game played by the respondents was found insignificant impact on the level of self-concept of the players.

Keywords: Self-concept (SC), volley ball players (VP), cricket players (CP)

INTRODUCTION
Self-concept is a multi-dimensional construct that refers to an individual's perception of “self” in relation to any number of characteristics, such as academics (and non-academics), gender roles and sexuality, racial identity, and many others. While closely related with self-concept clarity it presupposes but is distinguishable from self-awareness, which is simply an individual's awareness of their self. It is also more general than self-esteems, which is purely an internal model which comprises self-assessments. Features assessed include but are not limited to personality, skills and abilities, occupation(s) and hobbies, physical characteristics, etc. Self-concept has been defined by different psychologists in different ways. Raimy (1943) defined self-concept as, “the more or less organized perceptual object results from present and past self-observations”, or “what a person believes about himself”. Self-concept is learned by an individual's interference from his unique experiences. Therefore self-concept is the core dimension of one’s personality. It determines the kind of adjustment the person will make. A change in the self-concept will bring changes in the entire personality. Changing one's self-concept requires tremendous insight. This means that a person must be able to see himself as he actually is, not as he would like to be or as others perceive him. Self-concept is an individual's way of looking at himself. It also signifies his ways of thinking, feeling and behaving.

STATEMENT OF THE PROBLEM
The statement of the research problem is as under: “Self-Concept of under Nineteen Volley Ball and Cricket Players”

OBJECTIVES OF THE STUDY
- To explore the level of self-concept of volleyball and cricket players.
- To explore the level of self-concept of cricket players.

HYPOTHESIS
- There exists no significant difference between volleyball and cricket players on their level of self-concept.
- There exists no significant difference between cricket players on their level of self-concept.

OPERATIONAL DEFINITION
- Self-Concept: Self-concept reflects to several kinds of identifiable personality traits such as self-confidence, self-assurance, self-assertiveness, self-esteem, self-regard, self-consistency, self-enhancement, self-respect.
- Volleyball Players: Volley ball players in the present study refer those respondents who are reading in different higher secondary schools of selected areas. Apart from this, it is imperative to mention here that only those volleyball players were selected who possess playing experience minimum 3 years.
- Cricket Players: Cricket players in the present study refer those respondents who are reading in different higher secondary schools of selected areas. Apart from this, it is imperative to mention here that only those cricket players were selected who possess playing experience minimum 3 years.
- Under Nineteen: Under Nineteen in the present study indicate that all the players belonging to all type of games will be selected below the age group of 19 years. As the respondents will be selected from the different higher secondary school. So in context to same, the age range of the players was 14-18 years.

DELIMITATIONS OF THE STUDY
- Delimited to 400 respondents only with due representation of the type of game.
- Delimited to two districts of Karnataka state in Dharawad Districts.
- Delimited to under nineteen volley ball and cricket players.

METHODOLOGY
Keeping in view, the research evidences, objectives and hypotheses, the researcher found it suitable to go through descriptive survey method. Accordingly, present study was carried with the help of descriptive method.

SAMPLE
400 volley ball and cricket players were selected by using convenient sampling technique. These required samples drawn from selected Districts of Dharawad division of Karnataka State.

DESCRIPTIVE ANALYSIS
The descriptive analysis has been made on the basis of game played by players. In this caption frequency and percent wise distribution was calculated. The detailed procedure is given as under:

Interpretation of table 1.1 (Fig. 1.1): The exploration of the table 1.1 (Please Consult Table 1.1, Fig. 1.1) gives information about the frequency and percent wise distribution of cricket and volleyball players on various levels of self-concept. The obtained results indicate that 4.00% (F=08) volleyball players were reported with extreme high level of self-concept. In pursuance to same, 5.00% (F=10) volleyball players were seen with high level of self-concept. Additionally, it was seen that 26% (F=52) volley ball players were seen with above average level of self-concept. Meanwhile, it was seen that 50.00% (F=100) volleyball players were seen with average level of self-concept. The results designate that 15% (F=30) volleyball players were reported with below average level of self-concept. Moreover, it was found that 0.00 (F=0.00) volleyball players were reported with low level of self-concept. Further, from the above reported results, it was seen that 0.00% (F=0.00) volleyball players were reported with extreme low level of self-concept. Coming towards the cricket players, it was seen that 2.5% (F=05) were reported with extreme high level of self-concept. In context to same, it was observed that 10% (F=20) cricket players were revealed with high level of self-concept. The inspection obtained results obtain that 25% (F=50) cricket players were observed with above average level of self-concept. Moreover, from the obtained results it was found that 55% (F=110) cricket players were seen with average level of self-concept. Meanwhile, from the gained results, it can be inferred that 7.5% (F=15) cricket players were seen with below average level of self-concept. The calculated results designate that 0.00% (F=0.00) cricket players were analyzed with low level of self-concept. In the meantime, it was found that 0.00% (F=0.00) cricket players were found with extreme low level of self-concept.

COMPARATIVE ANALYSIS
The comparative analysis was made on the basis of type of game played by the respondents. In this caption ‘t’ test was employed for drawing the generalizations. The detailed procedure is reported as under:

Table 1.2 showing the mean significance difference between volleyball and cricket players on their level of self-concept of sports personality test. (N=200 each)

Fig: 1.2: Showing the graphical representation of volleyball and cricket players their mean level of on Self-concept of sports personality test.

INTERPRETATION OF TABLE 1.2 (FIG. 1.2)
The momentary look on the table 1.2 (Please refer table 1.2, Fig. 1.2) gives inception about the mean significance difference between volleyball and cricket players on dimension-IV (self-concept) of sports personality. The results indicate that the mean score of volleyball players was reported 45.70 and the mean score of cricket players was reported 45.34. Thus, from the above reported results, it was observed that the mean score is relatively identical. The same table indicates that when the both group of players (cricket and volleyball) players were comparatively analyzed with the help of independent ‘t’ test, the calculated ‘t’ value was reported 0.62. Juxtaposing it on the index level, it was found below the calculated value at 0.05 level of confidence. Thus, from the above reported result, it can be inferred that there exists no significant difference between volleyball and cricket players on their level of self-concept. Thus, type of game seems insignificant impact on the level of self-concept of the volleyball and cricket players. Both the type of players (Volleyball and cricket) were found with identical level of self-concept as they reflects to several kinds of identifiable personality traits such as self-confidence, self-assurance, self-assertiveness, self-esteem, self-regard, self-consistency, self-enhancement, self-respect. They perceives of himself and their Self-confidence and self-assurance in their day to day activities are expressed in behavior as cheerful, resilience, toughness, placidity, experience, carelessness, vigor, energy, fearlessness and self-security. Indeed no significant difference has been reported between volleyball and cricket players on their level of self-concept of volleyball and cricket players. So in context to same, the status of the hypothesis has been reported as under:

CONCLUSIONS
“The aim of the study was to explore the level of the level of self-concept of volleyball and cricket players. In pursuance to same, no significant difference has been found between volleyball and cricket players on their level of self-concept. The result may attribute to this fact that both type of games are played in team spirit. So the group and team and group spirit facilitates cohesive culture with players. Consequently, these games provide identical level of approach for boasting the level of self-concept of the players”.
