Abstract:

Background: Polycystic ovary syndrome has greater impact on today's life of women. Lifestyle modification and weight management plays a key role in management of PCOS. This study was carried out with the purpose to observe the Impact of Life Style Modification Behavior on Physiological Parameters, sleep pattern and Quality of Life among patients with Poly Cystic Ovarian Syndrome in tertiary care hospital.

Method: Quasi-Experimental study was conducted among 78 patients with Poly Cystic Ovarian Syndrome. In this study one group pre- test, post- test research design was used. Samples were selected by using purposive sampling technique who met the inclusive criteria. Data were collected by using physiological parameters scale, PSQI scale and WHOQOL-BREF questionnaire before the intervention after that life style modification behavior module was introduced on the same day. After that post intervention data was collected by using same tools after 4 weeks of application of intervention. Reliability of the tool PSQI was calculated by using Cronbach's alpha method i.e. 0.736. Reliability of WHOQOL-BREF questionnaire was calculated by Cronbach's alpha method i.e. 0.782 to 0.832.

Result: Result of the study showed that Life Style Modification Behavior module was effective in improving physiological parameters, sleep pattern ($p < 0.0001$) and quality of life ($p < 0.0001$) at $p < 0.05$ among patients with PCOS after intervention.

Conclusion: Research findings revealed that Life Style Modification Behavior is effective non- pharmacological treatment of Poly Cystic Ovarian Syndrome. Hence the Life Style Modification Behavior intervention was effective non pharmacological treatment for maintaining physiological parameters, improving sleep pattern, improvement in quality of life among patients with PCOS.

Keywords: Life Style Modification Behavior, Physiological parameters, Sleep pattern, Quality of Life, Patients with PCOS.

INTRODUCTION

In polycystic ovarian syndrome there is imbalance in level in estrogen, follicle stimulating hormone and luteinizing hormone, progesterone and also androgen hormone.¹

There are three major estrogens, known as estradiol, estrogen, and estriol. They work together to promote the healthy development of female sex characteristics during puberty and to ensure fertility. When there is excess production of these hormones, it leads to weight gain, premenstrual syndrome, menstrual disturbance like irregular and heavy bleeding, ovarian cysts etc. If these hormones produced in less amount it leads to anxiety, irritability, anger etc.²

Poly Cystic Ovarian Disease is the most common hormonal disorder in women of reproductive age. It is a condition in that women have difficulty to becoming pregnant and have high androgen level from ovary and adrenal gland. This disrupts the normal menstrual cycle and may lead to infertility, excess body hair and acne.³

In 2019, according to Institute of Medical Sciences stated that women with Poly Cystic Ovarian Syndrome are commonly shows the symptoms like sleep disturbance, abnormal menstruation, physiological parameters, obesity, hirsutism, hormonal imbalance and infertility.⁴

In 2020 according to BMC Endocrine Disorders research Centre stated that there is a significant association between life style modification and anthropometric, clinical, and biochemical parameters in adolescent girls with Poly Cystic Ovarian Syndrome.⁵

Present day lifestyle, food habit, environment exposure to toxins along with hereditary predisposition for metabolic syndrome (obesity, hyperlipidaemia, diabetes and hypertension) and stress has contributed to the common problem faced by today's female population which is polycystic ovarian disease because sedentary lifestyle and lack of exercises and fast food consumption by the women are leading to the leading to the rise in cases of Poly Cystic Ovarian Disease especially in urban population.⁶

There is no cure of Poly Cystic Ovarian Syndrome (PCOS) but treatment is available to alleviate the symptoms. Medical management and lifestyle modification are the best way to treat the disease. So, the goal is to assess the quality of life women with Poly Cystic Ovarian Disease in order to do lifestyle modification. The on-going goals are to prevent long term complication and to improve the fertility of the women.⁷

MATERIAL AND METHODOLOGY

Quasi-Experimental study was conducted among 78 patients with Poly Cystic Ovarian Syndrome. In this study one group pre- test, post- test research design was used. Samples were selected by using purposive sampling technique who met the inclusive criteria. Data were collected by using physiological parameters scale, PSQI scale and WHOQOL-BREF questionnaire before the intervention after that life style modification behavior module was introduced on the same day. After that post intervention data was collected by using same tools after 4 weeks of application of intervention. Reliability of the tool PSQI was calculated by using Cronbach's alpha method i.e. 0.736. Reliability of WHOQOL-BREF questionnaire was calculated by Cronbach's alpha method i.e. 0.782 to 0.832.

Data Collection process

Data collection was done from 28.02.2022 to 20.05.2022 in Gynae OPD at Queen Mary Hospital Lucknow; U.P. Ethical permission was obtained from concerned authority [No.2149/Ethics/2022]. Sample was selected by purposive sampling techniques according to inclusion criteria. Self-introduction and purpose of the study was explained to the subjects. Informed consent was taken from the participants. Then demographic data was obtained from participants. Assess the pre-test score related to physiological parameters, Sleep pattern, and Quality of Life before application of intervention. On the same day researcher had explained about Life style Modification Behavior intervention and advice to follow for 4 week. Reminder was made two times in a week via phone call to ask about whether they were follow the Life Style Modification Behavior intervention plan or not. Post – test data was obtained by using same tools after 4 week.

Development and Description of Tool

Assessment of demographic variables and clinical variables

Demographical variables it consists of 6 items i.e. age (in years), educational qualification, marital status, occupation, Income.

Clinical variables it deals to assess the clinical variables related to menstruation.

It consists of 8 items i.e. Pattern of menstruation cycle, Age of menarche in years, how many sanitary pad / day used, Association of pain with menstruation, Frequency of menstruation, Duration of Polycystic ovarian syndrome, Family history of present illness, Presence of symptoms in Polycystic ovarian syndrome.

Physiological parameter Scale

It deals to assess the physiological parameters before and after the intervention to evaluate the impact of Life Style Modification Behavior on physiological parameters. It consists of 6 parameters i.e. BMI, Weight in kg, Waist circumference (cm), Hip circumference (cm), Level of Luteinizing hormone, Level of follicle stimulating hormone.

Pittsburgh sleep quality index (standardized tool)

Pittsburgh sleep quality index questionnaire is a standardized tool for the assessment of quality of sleep among women with Poly Cystic Ovarian Syndrome. In that questions are given relate to usual sleep habit. Candidate should tick right on the answer. The scale is used to assess the sleep habits for the majority of days and nights in the past month. Scale contains 19 self-rated questions and 5 question rated by the bed partner or roommate (if one is available). Only self -rated questions are included in the scoring, with the scoring range 0-21 points, 0-3 have mild difficulty and 21 score have worse condition in all areas.

WHOQOL - BRIEF checklist (standardized tool)

WHOQOL - BRIEF checklist is a standardized tool it is used to assess the quality of life of women with Poly Cystic Ovarian syndrome (PCOS). In that questions were ask how you feel about your quality of life. Candidates were read out each question and tick right mark with the response options. Responses of the candidate were checked before and after application of intervention.

Data analysis

The process of data analysis involves numerous stages. It starts with raw data encoding further decoding for the data analysis. After decoding it formulated in statistical format to acquire specific data to check its association required in the study. The data analysis will be done by SPSS (version 23) and Excel Software. Descriptive statistics (frequency, percentage) for the assessment and inferential statistics (chi-square test, Wilcoxon test, paired t – test, Karl person's coefficient for correlation, and ANOVA test for the association) was used.

RESULT

Socio-demographic profile and clinical variables

Majority of the patient were in the age group of 24-27 years 37 (47.4%). Most of the patients were 12th passed 27 (34.6%). Most of the patients were unmarried 51 (65.8%). Most of the participants were doing job 30 (38.5%). Most of the patients family income were >20000 rupees 33 (41.7%).

In clinical variables majority of the patients had irregular menstrual cycle 59 (75.6%). Age of menarche in most of the patient was 13-14 years 41 (52%). Most of the patient used 4-5 sanitary pads in a day 27 (34.6%). Most of the patients had moderate pain in menstruation 34 (43.5%). Most of the patient had frequency of menstruation <28days 23 (29.5%). Family history of PCOS was absent in most of the patients 44 (56.4%). Most of the patients PCOS symptoms were Hirsutism 26 (33.3%).

Frequency and Percentage distribution based on the pre and post- test score of physiological parameters

Most of the patients were overweight before intervention 39 (50%). After intervention most of the patients had normal BMI 40(51.3%). Most of the women had overweight before intervention 40 (51%) after intervention most of the patients had normal weight 44 (56%). Before intervention most of the patients had medium hip circumference 67 (86%) after intervention 72 (92%) patients had medium hip circumference. Before intervention most of the patients had overweight waist circumference 50 (64%). Most of the patients had above than normal level of LH hormone before intervention 51 (65.4%) after intervention it was reduces 33 (42.3%). Before intervention FSH level of most of the patients were 44 (56.7%) after intervention it reduces in number 37 (47.4%).

Effectiveness of module LSMB on quality of life and sleep quality index among PCOS patients before and after intervention

There was significant improvement seen in scores of all component of PSQI after intervention, with p value < 0.0001 and there was significant improvement seen in all the domains of QOL, after intervention, with p<0.0001.

Compare the sleep pattern and quality of life among PCOS patients before and after intervention

Result shows that average sleep pattern after intervention was improved (5 ± 1) as compared to before intervention (11 ± 2) with the $p < 0.0001$. So that there was a significant impact of LSMB on sleep pattern after intervention and average quality of life after intervention was improved (219.6 ± 7.8) as compared to before

intervention(106 ± 5) with the $p < 0.0001$. So that there was a significant impact of LSMB on quality of life after intervention

Correlation of demographic variable with physiological parameters, Sleep quality index and quality of life before and after intervention

There is weak positive correlation was observed between weight and marital status ($r=0.249$, $p=0.028$), as well as between weight and occupation ($r=0.292$, $p=0.009$) at $p < 0.05$.

There was weak positive correlation was observed between marital status and component 3 of PSQI ($r=0.291$, $p=0.010$). Weak negative correlation was observed between occupation and Component 4 ($r=-0.231$, $p=0.042$), occupation and Component 5 ($r=-0.291$, $p=0.010$), occupation and Total PSQI score and occupation ($r=-0.233$, $p=0.04$) at $p < 0.05$.

There was weak positive correlation was found between Age and Domain 2. ($r=0.287$, $p=0.011$) and age and total QOL Score ($r=0.232$, $p=0.041$). Weak positive correlation was observed between education and Domain 4 ($r=0.232$, $p=0.041$). Weak positive correlation was observed between occupation and total score of QOL ($r=0.263$, $p=0.02$) at $p < 0.05$.

Association between physiological parameters, sleep pattern and quality of sleep with the selected demographic variables and clinical variables

There Statistically Significant association was found between BMI v/s Occupation and Income; Weight v/s Occupation and Income; Waist circumference v/s age and Income, LH v/s Occupation; and FSH v/s Education at $p < 0.05$.

Statistically Significant association was found between Hip Circumference v/s number of pad; Waist circumference v/s duration of disease; and LH v/s frequency of pad change, at $p < 0.05$.

No significant association was observed between demographic parameters and components of PSQI at $p < 0.05$.

No significant difference was observed between clinical parameters and components of PSQI as $p > 0.05$

No significant difference was observed between demographic parameters and QOL as $p > 0.05$.

No significant difference was observed between clinical parameters and QOL as $p > 0.05$.

DISCUSSION

Demographic Variables and clinical variables

The invisible sufferings caused by unhealthy lifestyle life style, affect physiological parameters, sleep pattern and affect every aspect of life compromise the quality of life not only the inactive symptoms but often beyond symptomatic recovery. In light of the referred literature, the present study observations of the variables are discussed below.

Cross-sectional study was performed to assess the quality of life and satisfaction level among women with PCOS. 504 women age between 26- 35 affected more. Most of the women are married, higher socioeconomic standing lead to better quality of life.⁸

Cross-sectional study was performed to assess psychological parameters in reproductive PCOS women. Study was conducted on 71 women. Women working in any job are more stressed that affect the quality of life of PCOS women.⁹

Present study shows that most of patient had irregular menstrual cycle. Age of menarche in most of the patient was 13-14 years. Most of the patient used 4-5 pads. Most of the patients had moderate pain. Most of the patient had menstrual cycle of >45 days. Family history of PCOS was present in most of the patient. Most of the patient suffered from Hirsutism. The literature supports to the finding are-

Cross-sectional study was performed to assess the quality of life and satisfaction level among women with PCOS. 504 women were selected for study. Finding revealed that most of the PCOS women had irregular menstrual cycle with heavy flow; women were experiencing severe pain on 1, 2 day of the menstruation.⁸

Case control study was conducted to assess Long and irregular menstrual cycles among women with polycystic ovary syndrome. Result revealed that women with PCOS had menstrual cycle length of >35 days. Most commonly symptoms in PCOS were hirsutism and acne.¹⁰

Assessment of physiological parameters

Present study shows that in pre- test most of the patient come under overweight by checking weight and BMI. Few patients are present in medium hip circumference; most of the patient waist circumference is seen overweight, LH and FSH level was irregular but after application of the Life Style Modification Behaviour most of overweight patient reduced their weight and become normal BMI. Most of the patient's Hip circumference became normal. Waist circumference of the overweight patient was reduced and became normal. Positive impact of LSMB was also seen in LH and FSH.

The study supported to the finding were-

Prospective Observational study was conducted to assess the impact of Poly cystic Ovarian Syndrome on Physiological parameters. Total 125 women are involved in the study. Result revealed that most of the women with PCOS had major problem, women suffering with increased BMI, lead to obesity. PCOS affect quality of life.¹¹

Cross sectional study was conducted to assess the physiological parameters among PCOS women, total 201 samples were selected. Result revealed that excess androgen level lead to increase BMI, women with PCOS have increase BMI, central obesity is mostly seen which is assess by increases hip circumference and waist circumference.²²

Experimental study was conducted to assess the role of lifestyle modification in polycystic ovary syndrome. Total 87 women were selected. Result revealed that application of Life Style Modification helps in successfully reducing weight, it also helps in decreasing hip and waist circumference.¹²

Assessment of quality of sleep among PCOS patients

The finding of the present study showed that there was significant improvement seen on quality of sleep after application of Life Style Modification Behaviour. The findings of study were also found to have the same result in many research studies.

Prospective cross-sectional study was conducted to assess Sleep Duration in women with Polycystic Ovarian Syndrome. Total 231 women are selected. Results of the study revealed that women with PCOS suffering with insufficient sleep. It increased risk of menstrual disturbances.¹³

Quasi-experimental study was conducted, to evaluate the effect of aerobic exercise on quality of sleep among PCOS student. Total 134 samples were selected. Result showed that there was significant improvement in the quality of sleep ($p < 0.001$ and $p < 0.0001$), after 4 week application of intervention.¹⁴

Experimental study was conducted, to assess the effect of Music Therapy on Quality of sleep among the student of nursing department. 100 nursing students were included. Result determined that significant improvement seen in quality of sleep by music therapy.¹⁵

Assessment of quality of life among PCOS patients

The finding of the present study showed that there was significant improvement seen on quality of life after application of Life Style Modification Behavior. The findings of study were also found to have the same result in many research studies.

Prospective case-control study was conducted to assess the impact of Poly Cystic ovarian syndrome on quality of life among women with polycystic ovary syndrome. Total 300 women are selected. Result shows that symptoms like increased BMI, menstrual irregularities, educational status and marital status play a major role in altering Quality of Life in women with PCOS.¹³

Cross-sectional study was conducted, to assess the effect of Life Style Modification Behavior on quality of life among PCOS women. Total 294 women were selected. Result shows that there is significant improvement seen in quality of life after following life style modification for 4 weeks and most effective treatment for PCOS is lifestyle modification.¹⁶

From the finding of the study, it has been observed that Life Style Modification Behavior helps in improvement in physiological parameters, sleep pattern and quality of life.

Positive finding of this study support a growing body of evidence that non pharmacological intervention such as Life Style Modification Behavior is effective for physiological parameters, sleep pattern and quality of life. Fresh hand education training can be given to nurses regarding Life Style Modification Behavior.
